Cord Cleaning: Full System Audit

Every page and tab, three screen sizes, three logins, plus backend, code and mobile-app checks · 28 September 2026 · for your review

289	900+	3	6	60
page visits (4 roles)	tabs, sub-tabs & filters clicked	screen sizes: 966 / 768 / 375 px	high-priority problems	items to review

How this was checked

- **Every screen, automatically:** a read-only crawler opened every page and clicked every tab, sub-tab, section dropdown and filter. It ran as **Admin** (60 pages), **Staff** (38 pages, including admin pages, to confirm they are refused), **Client** (27 pages) and **logged-out** (10 public pages), at desktop, tablet and phone widths. It recorded crashes, error messages, failed server calls, console errors, blank pages, content running off the screen and very small tap targets. All saving and sending was blocked during the crawl, so no data was changed.
- **Code and tests:** TypeScript build, ESLint, frontend tests (48/48 pass), backend tests (666/666 pass), dependency security audit (0 known vulnerabilities), and `flutter analyze` on both mobile apps.
- **Server log:** reviewed for errors raised while all of the above ran.

Not covered: the platform-operator (superadmin) screens, which can't be opened on the local dev address; actually submitting forms (the crawl was read-only); and real devices (phone and tablet were emulated in the browser). Timings are inflated because the dev backend talks to a remote database, so only the slowest calls are listed.

1. Bugs & errors

#	WHERE	WHAT'S WRONG	SUGGESTED FIX
1	Site → Maps tab HIGH	Crashes for everyone with "Something went wrong" (*Cannot read properties of null (reading 'geofenceRadiusMeters')*). `Map.tsx` still reads an old URL parameter that the site page no longer has, so the site data is always empty.	Take the site from the page's own site data (the same way every other site tab does).
2	Sidebar, all pages HIGH	An endless re-render loop ("Maximum update depth exceeded", about 500 errors in a few minutes) whenever the sidebar is expanded: **every phone user**, and desktop users who open the sidebar. It burns CPU and battery and made the phone layout stick on the loading screen during testing.	One-line change in `SidebarTenants.tsx`: only update the open menus when something actually changed. Verified: the loop disappears.
3	Invoice create/edit HIGH	Changing only the **currency, exchange rate or tracking tag** can save the previous values. The save handler doesn't watch those three fields. (From this week's multi-currency work.)	Add the three fields to the save handler's dependency list.
4	Client → Client Details (edit) HIGH	**Company Type shows blank** even though it's saved (e.g. "Hourly"). The form fills in before the options load. Saving then fails validation or loses the type.	Fill the form after the company-type options have loaded.
5	Chat (live updates) HIGH	The chat websocket uses the website address the browser sends as the database schema, so every web chat frame hits "Invalid tenant schema identifier" and "who's online" silently fails. Joining a chat channel also isn't checked against the user's own business: **possible cross-business chat access, needs a security review.**	Work out the business from the signed-in user's token, not a browser header, and check every channel subscription belongs to that business.

6	**Time Sheet → Generate** MED	Pressing Generate without dates causes a server error (500: invalid date ""). The page doesn't catch it.	Require the dates on screen, and reject empty dates with a clear 400 on the server.
7	**Pages calling the wrong role's data** MED	Several pages ask the server for data the signed-in role can't have, which causes errors and wasted calls: • **Admin**: My Availability, Profile Update Requests, Staff Expense Claims → "You are not a staff member". • **Staff**: Staff Expense Claims and Profile Update Requests → admin-only "pending" lists (403); Profile → company profile (403). • **Client**: E-Learning → every call 403 (page empty); Chat → "Board" tab 403 plus an unhandled error.	Only request the data for the user's own role, and hide tabs they can't use.
8	**Client profile** MED	Both `/client-profile` and `/profile` send a **client** to Access Denied. Clients have no way to view or edit their own details.	Allow the client-profile page for clients (it looks like a route permission).
9	**Master Configuration → Audit Trail** MED	The Details column shows the word **"null"** (e.g. a change "from null"). The server builds the message text without handling empty values.	Write "(empty)" or leave the part out when a value is missing.
10	**Site page lists** MED	React warns "two children with the same key" (the key is *null*) on Site Details, Overview and Role List. Rows can be duplicated or dropped when the list changes.	Use a real unique id as each row's key.
11	**Push notifications** MED	Every push fails on this setup: *Firebase service-account file not found*. It may only affect this machine, but please confirm on the live server.	Make sure each business's Firebase file is on the server; alert when it's missing.
12	**Site → Chat Room images** LOW	8 image attachments return "not found" (404). The files may just be missing from this dev machine; please confirm on the server.	Check upload storage; show a placeholder when a file is missing.
13	**Subcontractors list** LOW	Requests a logo for every subcontractor, including those without one (404), and requests each logo twice.	Only request a logo if one exists, and only once.
14	**Dashboard onboarding** LOW	"Add your first site / Add your first staff member" still shows although the business already has sites and staff.	Hide steps that are already done.
15	**Browser tab title** LOW	Every business sees **"Primos Enterprise Admin"** in the tab title until the page loads, which is a brand leak for other businesses. Cleara's stored company name shows as "Center of Research and Development Pvt. Ltd." (test data?).	Use a neutral default title; check Cleara's company name.
16	**Client dashboard map** LOW	Uses Google's deprecated `Marker` (console warning; Google will remove it).	Switch to `AdvancedMarkerElement`.
17	**Tab buttons** LOW	Tab buttons across the app have no `type="button"`. Harmless today, but inside a form they would submit it.	Add `type="button"` in the shared tab styles.

2. Screen-size problems

Desktop 966px, tablet 768px, phone 375px. "Scrolls sideways" means part of the page runs off the edge, so the whole page slides left and right.

#	PAGE	SIZE	PROBLEM
18	**Fixed Assets**	all sizes	Table (900px) is wider than the page. The **Schedule / Edit** buttons are cut off at the right, and the page scrolls sideways, even on desktop.
19	**Site → Time Allocation**	desktop, tablet	The time grid is 2,702px wide and makes the **whole page** scroll sideways instead of scrolling inside its own box.
20	**Finance → Overview**	phone	"Add Maintenance Record" button pushes the page 67px past the screen; 12 buttons are too small to tap comfortably.
21	**Finance → Reconciliation**	phone	Step buttons ("3. Rules & Insights") run about 90px off screen; the account-type dropdown on the Rules step too.
22	**Finance → Statements (Financial Year, Cash, Accrual)**	phone	The financial-year dropdown is 430px wide on a 375px screen.
23	**Finance → Staff Utilization, Credit Notes**	phone	Legend text / helper text overflow by about 10px.
24	**Accounts Payable → Bills, Recurring Bills**	phone	Tables aren't in their own scroll box, so the whole page scrolls sideways (up to 489px).
25	**Site page (every section)**	phone	"Transfer Site" button runs off the edge. **User List** has 30 tiny tap targets; the **Edit Work** calendar toolbar overflows ("Agenda") with 35 tiny targets.
26	**Add Incident (staff)**	phone	Step indicator runs off screen ("About" ends at 402px).
27	**My Availability (staff)**	phone	Calendar is 23px too wide.
28	**Tables with no phone layout**	phone / tablet	Need sideways scrolling: client dashboard, My Invoices, My Payslips, invoice line items, Trial Balance, Super Payments, and the Incident list on tablet. The shared table already has a phone "card" layout; these tables don't use it.
28a	**Site Management list**	phone	Content is 470px wide on a 327px area, so the page scrolls sideways on every tab (Active, Incomplete Setup, Deactivated).
28b	**Schedule**	phone	Toolbar ("This Week" button and date field) runs about 70px off screen, so the page scrolls sideways; the schedule grid needs sideways scrolling.
28c	**Time Sheet (list)**	phone, tablet	Date column runs 25px off screen, so the page scrolls sideways; 9 tiny tap targets. Generate Timesheet has 10 tiny checkboxes.
28d	**Fixed Assets, Inventory**	phone	Tables (900px / 580px) aren't in a scroll box, so the whole page scrolls sideways. The search box also overflows.
28e	**CRM**	phone	The New Deal / New Contact / New Lead button row runs 50px off screen, so the page scrolls sideways.
28f	**User Management**	phone	49 tap targets smaller than 28px (row action icons); page 2 of the list scrolls sideways slightly.
28g	**Report Builder**	phone	"Save Report" button runs 34px off screen, so the page scrolls sideways.
28h	**Small tap targets (phone)**	phone	Many pages have icon buttons or checkboxes under 28px: Users (49), Edit Work calendar (35), Site User List (30), Notification Types (13), Send Notification (11), Generate Timesheet (10), Form editor (9), Time Sheet (9). The comfortable minimum is about 40px.

28i	**Master Configuration → Public Holidays**	phone	"Add Holiday" button runs 38px off screen, so the page scrolls sideways.
28j	**Subcontractors list**	tablet	"Add Subcontractor" button runs 23px past the edge, so the page scrolls sideways.

3. Navigation & access gaps

#	WHO	PROBLEM	SUGGESTED FIX
29	Everyone MED	**5 finished pages have no menu entry for anyone** and can only be reached by typing the address: Staff Scorecard, Staff Policy Library, Staff Expense Claims, My Availability, Profile Update Requests.	Add them to the right role's menu.
30	Staff HIGH	The staff menu shows only Dashboard, Documents, Incidents, E-Learning and My Payslips. **Time Sheet** and **Staff Leave Request** send staff to Access Denied, so staff can't see their hours or request leave on the web. Availability, Expense Claims, Policy Library, Chat and Profile Update Requests work but have no menu link.	Give staff a menu with the pages built for them, and allow a staff version of Time Sheet and Leave.
31	Client MED	The client menu shows only Dashboard and Documents. **My Invoices** works but isn't in the menu; the profile page is denied (#8); **E-Learning** appears but is empty for clients (#7).	Client menu: Dashboard, My Invoices, Documents, Profile. Hide E-Learning for clients (or allow it).
32	Admin LOW	Needs Attention is only reachable from a Dashboard button.	Add it to the menu (with a count badge).
	OK	Access control held everywhere: every admin page correctly refused staff and client logins, and public links with bad tokens show clear "invalid or expired" pages.	

4. Code quality, tests & mobile apps

#	AREA	FINDING
33	ESLint (web) LOW	940 findings: 873 are the loose `any` type (mostly `api.ts` and `financeHooks.ts`), 15 unused variables, 6 empty error handlers in `InspectionTab.tsx` that swallow errors silently, 7 hook-dependency warnings (one is bug #3; others in the Users page, client invoice history, incident trend chart, staff availability and superadmin dashboard), 2 `@ts-ignore` in the shared table, and 4 stale disable comments.
34	Automated tests MED	All pass (backend 666, frontend 48), but they're unit tests only. Nothing tests pages end to end, which is why bugs #1–#4 got through.
35	Mobile apps OK	`primos_enterprise_cleaning`: no issues. `multi_tenant_mobile_app`: 0 errors, 3 deprecation notices (chat list `cacheExtent`). Both apps lack this month's web features (payslips, client Pay Now, multi-currency…) and have drifted apart from each other.
	OK	TypeScript build clean; 0 known vulnerable dependencies.

5. Performance

#	AREA	FINDING
36	Header badges MED	Every open tab re-downloads the full chat conversation list, site chat list and notification count **every 30 seconds** just to show unread badges. The app already has a live websocket that could push these.

37	**Slow screens** MED	Slowest calls in this test: HR reminders (Dashboard) 35s, suggested staff (Site → Time Allocation) 34s, the site list around 11s, notice board 8s. The remote dev database inflates these, but they're the ones to profile and index first.
38	**Full-screen loader** LOW	Most pages block the whole screen with a spinner until every call returns (the Site page spun for more than 12s). Showing the page with loading placeholders feels much faster.

6. Still outstanding from earlier lists

Started, not finished

- Accounting sync: push & pull of all data with Xero/QuickBooks
- Security screen for the new session backend (active sign-ins, force logout, login history, timeout setting, API keys). The backend is done and pushed; the screen isn't built.

Built, needs a hands-on test (saving real data)

- Budget editing, super payments, cash/accrual, tracking, receipt scanning, multi-currency. All their screens and tabs **load with no errors** in this audit; saving wasn't tested.
- Deposit invoices & quote e-sign; client messaging & service requests
- Production database backups running on a schedule

Blocked on an outside account

- Live bank feeds (Basiq), STP lodgement (ATO), Xero/QuickBooks developer app
- SMS (Twilio), calendar push, DocuSign, Google/Microsoft sign-in, review requests
- Chat translation & SMS fallback (WO-058/061)

Optional features not yet built

- Review-request sending (#18)
- Replace active/inactive toggle; announcement banner; duplicate site; role templates
- Multi-level leave approval; notification channel preferences
- Opening-balance import; custom fields on invoices; nightly ledger-vs-GL check
- GST on recurring expenses; FX revaluation; industry benchmarking
- Mobile apps catch-up with web features

Code health from the earlier list

- Integration/end-to-end tests; accrual reports in SQL; depreciation schedule; rebill-queue lookups; shift-reminder memory; close out old bug list

Done since the last list

- Refresh-token fix, leave approval limited to supervisors, JWT library upgrade, duplicate sign-up page removed, session-security backend

7. Suggested improvements

#	SUGGESTION	WHY
39	**Role-based menus**	Build proper Staff and Client menus from the pages that already exist (#29–31). This is the biggest usability win for the least work.
40	**Staff self-service on the web**	Own timesheet (read-only), leave requests, availability, expenses and payslips in one "My work" area.
41	**Client portal completion**	Profile, invoices & statements, contracts, service requests and "Pay now" in the client menu.
42	**Phone layouts for every table**	Reuse the shared table's card view for the custom tables (#28), and wrap wide tables in their own scroll box (#18, #19, #24).
43	**Live badges over the websocket**	Push unread chat and notification counts instead of polling every 30s (#36), which cuts server load a lot.
44	**Loading placeholders instead of a full-screen spinner**	Pages appear instantly and fill in as data arrives (#38).

45	**Nightly "smoke test"**	Turn this audit's read-only crawler into an automatic check (every page, every tab, three sizes, three roles) that runs before each deploy, so crashes like #1 never reach users.
46	**Link-able tabs everywhere**	Finance already keeps the open tab in the web address (`?tab=`); doing this on every tabbed page lets people bookmark and share a view, and makes Back work.
47	**Websocket & header hardening**	Derive the business from the login token everywhere, never from a browser-supplied header (#5).
48	**Accessibility pass**	Bigger tap targets (at least 40px) on phone, labels on icon-only buttons, and proper tab roles for screen readers. Not fully covered here.
49	**White-label polish**	Business name and logo in the browser tab title and icon from the first moment (#15).
50	**Operator screens testable locally**	Add a dev setting so the superadmin app can be opened and audited like the rest.

Note: during the audit I made one temporary local edit to stop the sidebar loop (#2) so the phone-size checks could finish. It is not committed and will be undone. Nothing else was changed, and no data was written. Your go-ahead decides what gets fixed.
