Implementation Roadmap
Closing the 61-Feature Gap Without Touching What Already Works

A phased build plan for every MISSING and PARTIAL item from the Full Feature Gap Analysis — sequenced by dependency, additive by design, with every gap traced to exactly one phase.

27 September 2026

The two constraints that shape everything below

1. Nothing is missed — every one of the 61 MISSING and 8 PARTIAL items from the gap analysis is assigned to exactly one phase below (see the traceability matrix at the end). Nothing is quietly dropped.

2. Nothing existing changes underneath the user — every phase is *additive*: new tables, new endpoints, new opt-in module flags. No existing endpoint contract, database column, or on-screen behavior is altered or removed. A tenant that never turns a new module on will not notice this roadmap happened at all.

How “additive-only” actually works, mechanically

- **New tables, not altered ones.** Chart of Accounts and double-entry Journal Entries are brand-new tables that sit ALONGSIDE the existing FinanceLedgerEntry (single-entry cash log). The old ledger keeps powering every screen it powers today, unchanged.
- **Parallel-run before switchover.** Every existing finance event (invoice raised, payment received, expense approved, payroll run) gets a second, silent hook that also writes a journal entry into the new ledger. Both ledgers run side by side; a reconciliation job checks they agree. Nothing user-facing reads from the new ledger until that's proven correct over a real reporting period.
- **Feature flags, reusing what already exists.** The app already has a Module + RoleModulePermission system that turns whole feature areas on/off per tenant/role (Finance, Payroll, Quotes, CRM already work this way). Every new capability below ships behind a new module flag in that same system, defaulted OFF, so rollout is a per-tenant opt-in, not a big-bang release.
- **New endpoints, not modified ones.** Where a feature extends something that exists (e.g. a Pay-Now button on an existing invoice), the existing endpoint/contract is left alone and a new endpoint/field is added beside it. Old API consumers (including the mobile apps) keep working without a rebuild.
- **Backward-compatible defaults.** Where a setting changes behavior (e.g. multi-rate tax codes replacing a flat GST rate, or award-rate payroll rules replacing hours×rate), the existing behavior becomes the pre-selected default for every existing tenant, so nothing changes unless someone deliberately opts in.
- **Regression suite as a gate, not an afterthought.** Phase 0 (below) is entirely about locking in today's behavior with tests BEFORE any new schema exists, so every later phase has an automatic tripwire if it accidentally changes something old.

Phase Overview

Phase	Focus	Depends on	Can run in parallel with
0	Stabilize the foundation — fix known bugs, lock in a regression safety net, wire up feature flags	—	Nothing — do this first
1	Core accounting backbone: Chart of Accounts, double-entry Journal Entries, multi-rate tax codes	Phase 0	Phases 3, 5, 6, 7 (independent modules)
2	Financial statements & tax compliance: P&L, Balance Sheet, Cash Flow, BAS, Trial Balance, FY report	Phase 1 (reads the new GL)	Phases 3, 5, 6, 7
3	Accounts Payable: vendor register, purchase orders, vendor bills, recurring bills, batch payments	Phase 1 (to post into the GL)	Phases 2, 5, 6, 7
4	Revenue capture & invoicing polish: Pay Now, credit notes, recurring invoices, dunning, billable expenses, quote e-sign	Phase 1 for GL posting; otherwise extends existing Invoice/Quote modules directly	Phases 2, 3, 5, 6, 7
5	Banking modernization: live feeds, bank rules, cash-flow forecasting, account types	Phase 0 only	All other phases
6	Payroll compliance: payslips, leave, award rates, PAYG, super, STP, multi-step approvals	Phase 0 only	All other phases — start early, longest external lead time (STP registration)
7	Fixed assets & inventory register	Phase 1 (optional GL posting)	All other phases
8	Platform hardening: granular permissions, accountant role, real Xero/QuickBooks sync, multi-entity, multi-currency	Phases 1–7 (wraps them for external consumption)	Runs last / continuously

Reading this as a timeline: Phase 0 always comes first. After that, Phases 1→2 are a dependent chain (the accounting backbone before the statements built on it) but Phases 3, 5, 6 and 7 don't depend on each other or on 1→2 finishing — they can be staffed and shipped in parallel by separate workstreams. Phase 4 mostly extends existing invoicing code directly and only needs Phase 1 for the handful of items that post to the GL. Phase 8 is a wrap-up pass once the modules it exposes externally actually exist.

PHASE 0 Stabilize the Foundation

No new user-facing features — this phase is entirely risk reduction.

- Fix the GST double-calculation bug: FinanceUtils.DEFAULT_GST_RATE and the independent ÷1.1 calc in FinanceServiceImpl.reconcile must become one shared function, so every later report (BAS included) starts from correct numbers.
- Fix the bank-statement Excel import stub (missing xlsx dependency) — currently fails outright.
- Write regression tests around today's exact invoice / payment / payroll / expense-claim behavior, so any later phase that accidentally changes existing output fails CI immediately.
- Stand up the module-flag scaffolding for every phase below, reusing the existing Module + RoleModulePermission mechanism — default state for all new flags is OFF.

PHASE 1 Core Accounting Backbone

Everything in Phase 2, and parts of 3/4/7, is built on top of this.

- Chart of Accounts: new per-tenant table, pre-seeded with a sensible cleaning-industry default set on tenant creation; existing tenants get the default set applied non-destructively (additive migration, no existing data touched).
- Double-entry Journal Entry engine: immutable once posted; corrections are always a reversing entry, never an edit — this gives Phase 0's audit-trail gap a real foundation too.
- Auto-posting bridge: hook into the existing invoice/payment/expense/payroll event points to also write a journal entry, in parallel with (not instead of) the existing FinanceLedgerEntry write.
- Multi-rate tax codes, replacing the flat 10% GST constant — the current flat rate becomes tax code #1 and is set as the default, so an existing invoice looks identical until a tenant adds a second code.
- Reconciliation job comparing old ledger totals vs. new GL totals nightly, surfaced to engineering — this is the proof gate before Phase 2 reports go live.
- Custom fields on transactions and tracking categories/classes: schema groundwork laid here (both are opt-in tagging, not required for any existing screen to keep working).

PHASE 2 Financial Statements & Tax Compliance

Read-only reporting layer on top of Phase 1's GL — zero risk to existing screens since these are entirely new pages.

- Profit & Loss statement
- Balance Sheet
- Cash Flow Statement (formal statement, distinct from the existing dashboard tiles)
- Trial balance / general ledger detail report
- BAS (Business Activity Statement) — GST collected vs. paid, aggregated from the new tax codes
- PAYG withholding summary report (the withholding calculation itself is Phase 6; this is the report once that data exists)
- Financial Year / Annual report (a formatted rollup of the statements above)
- Cash vs. accrual reporting-basis toggle
- Chart-of-accounts / opening-balance import tool, extending the existing invoice-import mechanism
- Industry benchmarking reports (lowest priority in this phase — defer to the end of it)

PHASE 3 Accounts Payable

A net-new module — does not touch the existing Invoice (AR) module at all.

- Vendor/supplier register (structurally parallel to the existing CRM contact model, but a separate table — CRM itself is untouched)
- Purchase orders
- Vendor bills

- Recurring bills (accounts payable)
- Batch vendor payments
- AP postings wired into the Phase 1 GL

PHASE 4 Revenue Capture & Invoicing Polish

Every item here is an addition to the existing Invoice/Quote screens — the current create/send/PDF/payment-tracking flow is not modified, only extended.

- Client “Pay Now”: wire the already-connected Stripe integration into the invoice PDF and client portal as a new button/endpoint
- Credit notes (new document type, linked to an invoice)
- Recurring/subscription customer invoices (new scheduler that calls the existing invoice-creation code path)
- Progress / deposit invoicing tied to a quote
- Batch invoicing
- Customer credit limits (ships as a soft warning first, not a hard block, so no existing workflow can be broken by it)
- Late payment fees / interest calculation
- Automated payment reminder emails (dunning), reusing the existing reminder-job pattern (certifications/shifts already work this way)
- Billable expenses: a new opt-in flag on an expense claim that adds it to the client's next invoice
- Client-facing quote accept/decline link
- E-signature on quotes, extending the existing DocuSign integration to a new document type
- Customer-facing account statements (new document, separate from the internal AR ledger)

PHASE 5 Banking Modernization

The existing manual CSV upload keeps working unchanged; live feeds are a new, additional data source into the same reconciliation screen.

- Live bank feed integration (e.g. Basiq for AU open banking) as an additional import source alongside CSV
- Bank rules / auto-categorization, shown as suggestions layered onto the existing manual-match UI
- Cash flow forecasting (new, read-only predictive view)
- Proper multiple account types (bank / credit card / loan) instead of one flat transaction concept

PHASE 6 Payroll Compliance

Highest regulatory risk and longest external lead time — start the STP registration process early since it runs on a government timeline outside engineering's control.

- Payslip PDF generation + a genuine employee self-service “my payslip” view (additive — today's admin-only payroll screens are untouched)
- Leave accrual tied into pay runs
- Award-rate / overtime / penalty-rate interpretation engine — config-driven per role, defaulting to today's flat hours×rate calculation so no existing tenant's pay run changes unless they opt in
- PAYG tax withholding calculation
- Superannuation calculation + clearing-house integration (the fund name/number fields already captured today become inputs to this, not replaced)
- Single Touch Payroll (STP) reporting — requires registering as an ATO-recognised digital service provider first
- Multi-level (multi-step) expense/purchase approval workflow — grouped here since it shares plumbing with payroll/expense governance

PHASE 7 Fixed Assets & Inventory

Lowest urgency for a services business — confirm actual demand (e.g. tracking cleaning consumables/PPE stock) before committing engineering time here.

- Fixed asset register with depreciation schedules (straight-line / diminishing value), posting depreciation journals into the Phase 1 GL
- Inventory / stock management — only if validated as needed

PHASE 8 Platform, Access & Ecosystem

A wrap-up pass — makes the modules built in Phases 1–7 properly accessible and connectable, without changing how any of them work internally.

- Granular finance sub-permissions (e.g. invoice-only, bank-recon-only) layered onto the existing module-permission model, not replacing it
- Read-only accountant/bookkeeper role, built on the same permission model
- Real Xero/QuickBooks data sync: implement the actual invoice-push service behind the OAuth “Connect” buttons that already exist
- Multi-entity / multi-business consolidated login
- Multi-currency support + FX revaluation (flagged as optional/low-priority unless multi-country expansion is actually planned)
- Expanded app marketplace / integration catalogue
- Careful, opt-in expansion of the public API to (some) finance data — today's “no financial data leaves this door” design is a deliberate security decision and should be revisited explicitly, not quietly reversed

Traceability Matrix — Every Gap, One Phase

Every MISSING or PARTIAL item from the Full Feature Gap Analysis, in the same order it appeared there, with its assigned phase. This is the checklist that proves nothing got left out.

A. Core Accounting Engine

Feature	Phase
Double-entry general ledger	**Phase 1**
Chart of accounts	**Phase 1**
Journal entries	**Phase 1**
Multi-currency	**Phase 8**
Multi-currency revaluation / FX gain-loss	**Phase 8**
Cash vs. accrual accounting toggle	**Phase 2**
Read-only accountant/bookkeeper access	**Phase 8**
Full journal-level audit trail	**Phase 1**
Chart-of-accounts / opening-balance import	**Phase 2**

B. Tax & Compliance

Feature	Phase
Multi-rate tax codes	**Phase 1**
BAS (Business Activity Statement)	**Phase 2**
GST collected-vs-paid summary	**Phase 2**
PAYG withholding summary report	**Phase 2**
Direct tax-authority lodgement (ATO SBR)	**Phase 8**
Contractor/1099-style payment summary	**Phase 2**

C. Financial Statements

Feature	Phase
Profit & Loss / Income Statement	**Phase 2**
Balance Sheet	**Phase 2**
Cash Flow Statement	**Phase 2**
Financial Year / Annual report	**Phase 2**
Trial balance / GL detail report	**Phase 2**
Industry benchmarking reports	**Phase 2**

D. Invoicing & Receivables

Feature	Phase
Customer-facing account statements	**Phase 4**
Client Pay Now / embedded checkout	**Phase 4**
Recurring/subscription customer invoices	**Phase 4**
Credit notes	**Phase 4**
Progress/deposit invoicing	**Phase 4**
Batch invoicing/payments	**Phase 4**
Customer credit limits	**Phase 4**
Late payment fees/interest	**Phase 4**
Automated payment reminders (dunning)	**Phase 4**
Billable expenses (rebill to client)	**Phase 4**

E. Quotes / Estimates

Feature	Phase
Client-facing quote accept/decline	Phase 4
E-signature on quotes	Phase 4

F. Payables / Vendor Management

Feature	Phase
Purchase orders	Phase 3
Vendor/supplier bills	Phase 3
Recurring bills (AP)	Phase 3
Batch vendor payments	Phase 3
Vendor/supplier contact management	Phase 3

G. Expenses

Feature	Phase
Multi-level approval workflow	Phase 6
Receipt OCR / auto data extraction	Phase 6
Billable-to-client expense flagging	Phase 4

H. Fixed Assets & Inventory

Feature	Phase
Fixed asset register	Phase 7
Depreciation schedules	Phase 7
Inventory/stock management	Phase 7

I. Banking

Feature	Phase
Live automatic bank feeds	Phase 5
Bank reconciliation (upgrade beyond manual CSV)	Phase 5
Bank rules / auto-categorization	Phase 5
Cash flow forecasting	Phase 5
Multiple bank/credit-card/loan account types	Phase 5

J. Payroll

Feature	Phase
Self-service payslip access	Phase 6
Payslip PDF generation	Phase 6
Leave accrual tied into payroll	Phase 6
Award-rate/overtime/penalty rules	Phase 6
PAYG tax withholding calculation	Phase 6
Superannuation calc/clearing house	Phase 6
Single Touch Payroll (STP) reporting	Phase 6

K. Budgeting, Categorization & Analytics

Feature	Phase
Budget creation/editing (currently read-only)	Phase 2
Tracking categories / classes	Phase 1
Custom fields on transactions	Phase 1
Supervisor/staff scorecard export	Phase 2

L. CRM & Contacts

Feature	Phase
Customer credit limits	Phase 4

N. Platform, Access & Ecosystem

Feature	Phase
Granular sub-module finance permissions	Phase 8
Read-only accountant role	Phase 8
Actual Xero/QuickBooks data sync	Phase 8
Multi-entity/multi-business consolidated login	Phase 8
Expanded app marketplace/integrations	Phase 8
Public API expansion to finance data	Phase 8

P. Client Portal

Feature	Phase
Client-facing online payment	Phase 4

Bugs found during the audit (fold into Phase 0)

Feature	Phase
GST double-calculation conflict	Phase 0
Bank-statement Excel import stub	Phase 0

Safety Checklist for Every Phase

- New module flag created, defaulted OFF, before the first line of feature code is written.
- Schema changes are additive-only (new tables/columns with defaults) — reviewed explicitly for any ALTER/DROP on an existing finance table.
- Existing regression suite (from Phase 0) run and green before merge.
- New endpoints only; any change to an existing endpoint's request/response shape is treated as a break-glass exception requiring sign-off.
- Pilot on one tenant with the flag on, observe a full billing/reporting cycle, before wider rollout.
- Rollback = flip the flag off. Because nothing existing was modified, disabling a new module cannot regress old behavior.

This roadmap sequences all 61 MISSING and 8 PARTIAL items from the Full Feature Gap Analysis into 9 phases (0–8), chosen purely by technical dependency — not by calendar estimate, since team size and priorities will determine actual timing. Phases 3, 5, 6 and 7 have no dependency on each other or on the 1→2 chain and can be resourced in parallel if more than one workstream is available.
