Report Generation
A Comprehensive Breakdown

Cord Cleaning Platform — every report, export and statement the system can produce today, and every one it can't.

27 September 2026

Category	Verdict
Tax / compliance reports (BAS, GST summary)	ABSENT
Financial statements (P&L;, Balance Sheet, Cash Flow, FY/Annual)	ABSENT
Generic report builder & tenant data export	REAL
Operational reports (attendance, payroll, AR, audit, PDFs)	REAL
Bank statement Excel import	STUB

Executive Summary

The platform has a genuinely strong **operational reporting** layer: attendance and timesheet workbooks, a payroll CSV export, an accounts-receivable ledger (Excel + PDF), an audit-log export, per-document PDFs (invoices, quotes, site inspections, toolbox talks, site photo reports), a working custom report builder, and a full tenant-wide data export with a scheduled/emailed backup job. All of this is real, wired end to end, and evidenced by working endpoints — not mock UI.

What's completely absent is **formal accounting/compliance reporting**: no BAS (Business Activity Statement), no GST summary report, no Profit & Loss statement, no Balance Sheet, no Cash Flow Statement, and no Financial Year / annual close report. GST today is only a flat 10% rate applied line-by-line on individual invoices — there is nothing to aggregate it into a lodgment-ready or board-ready statement. These would be built from a standing start; there is no partial version to extend.

1. Tax & Compliance Reports — BAS / GST

VERDICT: ABSENT — no endpoint, service, DTO, or page of any kind.

- No file, class, endpoint or variable named anything BAS-related exists anywhere in the backend or frontend.
- GST exists only as a flat, hardcoded 10% rate (`FinanceUtils.DEFAULT_GST_RATE`) applied to individual invoice line items — never aggregated into a report.
- A second, independent hardcoded GST calculation (÷1.1) exists in `FinanceServiceImpl.reconcile` — a separate source of truth from the one above, which is itself a data-integrity risk even before a BAS report is built on top of either.
- No "tax report" or "tax summary" endpoint exists in any controller.
- A real BAS report would need: GST collected (on sales) vs. GST paid (on purchases/expenses) totals per quarter, a PAYG withholding summary, and a lodgment-ready output format — none of which the data model currently separates out.

2. Financial Statements — P&L, Balance Sheet, Cash Flow, Financial Year

VERDICT: ABSENT — nearest features are dashboards, not statements.

Statement	Status	Closest existing feature
Profit & Loss / Income Statement	**ABSENT**	Site Profitability (per-site margin) + Finance Dashboard KPI tiles — neither is a line-itemized company-wide P&L
Balance Sheet	**ABSENT**	No assets/liabilities/equity modelling exists anywhere in the entity layer
Cash Flow Statement	**ABSENT**	Dashboard shows cash inflow/outflow tiles, not a formal statement
Financial Year / Annual / Year-end report	**ABSENT**	FinanceController.getYearOverYear() is a comparison chart, not an FY close/report

Grepped case-insensitively for profit-loss, balance-sheet, financial-year, annual-report and year-end terminology across the entire backend and frontend trees — zero matches in both.

3. Report Builder & Data Export — Real, Implemented

VERDICT: REAL — three distinct, working mechanisms.

3a. Generic CSV export (Table.tsx)

- Every table built on the shared `Table.tsx` component gets an "Export CSV" button for free.
- Exports whatever is currently filtered/sorted on screen, not just the raw dataset.
- Per-column `csvAccessor` lets JSX/render-function columns supply clean plain-text for export; a per-page `exportFilename` customizes the download name.

3b. Custom Report Builder (WO-095 / WO-105)

- Frontend: pick a data source, pick/reorder columns (drag-and-drop), apply one filter (contains/equals), preview, export to CSV.
- Five curated data sources, each reusing an existing endpoint: Sites, Clients, Subcontractors, Payroll, Incidents.
- Backend persists saved report **templates** (name, data source, columns, one filter) via `ReportTemplateController` — full CRUD, admin-only, soft-delete.
- Filtering and column selection happen client-side over the full result set — no server-side pagination or filter params yet.

3c. Full Tenant Data Export

- `GET /tenant/data-export/full` — a ZIP of 16 CSVs: companies, sites, staff, invoices, payroll, subcontractors, users, roles, audit log (capped 20,000 rows), staff document metadata, incidents, inspections, leave requests, and CRM contacts/leads/deals.
- Recurring export scheduling (frequency in days + recipient email) with run history, driven by a daily cron job that emails the ZIP to every due tenant.
- Frontend UI lives under Master Config → Data & Security, with a manual download card and a scheduled-export config card.

4. Operational Reports — Full Inventory

Report	Format	Scope / Filters	Status
Site photo/task report	PDF	Single site, date range; before/after photos grouped by date	**REAL**
Attendance/timesheet workbook	Excel	Company-wide, date range, colour-coded by status; admin-only	**REAL**
Timesheet Excel (site/company)	Excel	Filterable by company IDs, site IDs, date range	**REAL**
Site Management report	Excel	Site pay rates / P&L per site; active/inactive toggle	**REAL**
Payroll export	CSV	Optional payrollId / date range / status filters	**REAL**
AR ledger	Excel + PDF	Non-cancelled invoices in a date range; admin-only	**REAL**
Audit log export	CSV	Search, action, entity type/ID, date range	**REAL**
Staff scorecard / performance	In-app view	Attendance + inspections + incidents, ranked	**PARTIAL**
Site inspection report	PDF	Single inspection	**REAL**

Report	Format	Scope / Filters	Status
Toolbox Talk record	PDF	Single safety-meeting record with signatures	**REAL**
Quotation	PDF	Single quote	**REAL**
Invoice	PDF	Single invoice, role-scoped to the client	**REAL**
eLearning certificate	PDF	Per-certificate; module itself is frontend-mocked	**PARTIAL**
Incident report summary	In-app view	Wizard assembly; no PDF/export endpoint found	**PARTIAL**
Full tenant data export	ZIP of CSVs	Tenant-wide, on-demand or scheduled	**REAL**
Custom report builder	CSV	5 curated data sources, saved templates	**REAL**
Bank statement import	Excel (import)	Non-functional stub — xlsx package not installed	**STUB**

Not found anywhere in the codebase, despite being specifically checked for:

- A payslip PDF (payroll export is CSV only, no per-employee payslip document).
- A dedicated compliance or subcontractor report beyond the Report Builder's generic subcontractor data source.
- Inventory/stock reports — there is no inventory module in the product at all.

5. Gap Summary

Gap	Why it matters	Build effort
BAS / GST summary report	Required for Australian quarterly tax lodgment — currently the tenant would have to reconstruct this by hand from raw invoice/expense data	Medium–High: needs GST-collected vs. GST-paid aggregation, plus fixing the two conflicting hardcoded GST rate calculations first
Profit & Loss statement	The single most-requested report from any small-business owner or their accountant/bookkeeper	Medium: revenue and expense data already exists in FinanceLedgerEntry; needs a proper line-item statement format, not just KPI tiles
Balance Sheet	Needed for loan applications, year-end accounting, and true accrual accounting	High: requires modelling assets/liabilities/equity, which doesn't exist in the schema at all today
Cash Flow Statement	Distinguishes cash-basis reality from accrual P&L — commonly required alongside P&L	Medium: dashboard already has the raw cash in/out numbers, needs formal statement structure
Financial Year / Annual report	Year-end close and comparison; currently only a year-over-year chart exists	Medium, once P&L/Balance Sheet exist — this becomes a formatted rollup of them
Payslip PDF generation	Staff currently only see payroll data if manually given the CSV export	Low–Medium: payroll data model already exists; needs a PDF template per pay run per employee
Fix bank statement import stub	Currently fails outright (missing xlsx dependency) — blocks any future bank-feed-adjacent reporting	Low: install/wire the missing package

6. Suggested Priority

1. **Fix the two conflicting GST calculations** (FinanceUtils.DEFAULT_GST_RATE vs. the hardcoded ÷1.1 in FinanceServiceImpl.reconcile) before building anything on top of GST data — this is a correctness bug hiding underneath every future tax report.
2. **Profit & Loss statement** — highest value per unit of effort; the underlying revenue/expense data already exists.
3. **BAS/GST summary report** — directly unlocks quarterly compliance for every Australian tenant, once the GST calculation above is fixed.
4. **Payslip PDF** — small lift, immediate staff-facing value.
5. **Balance Sheet + Cash Flow Statement + Financial Year rollup** — larger effort, sequence after the above since they build on the same ledger/statement infrastructure.

Compiled from a direct code audit of multitenant_cleaning_backend and cleaning_frontend — every claim above is backed by a concrete file, endpoint, or grep result, not inference.
