COMPLETE QA TEST PLAN · PRIMOS ENTERPRISE CLEANING

Everything QA Needs to Test — Web & Mobile

A full sweep of the whole app, not just what changed recently: every module, every role, both platforms. Recently-changed areas are marked NEW and given full step-by-step detail since they're the highest-risk; everything else gets a solid core checklist. Work top to bottom, or jump around using the index below.

25 web modules | 21 mobile screens | 4 roles: Internal / Supervisor / Client / Subcontractor

Web branch: staging | Mobile build: 2.1.3 (64)

INDEX

SETUP

1. Before you start
2. Role access matrix

PART 1 — WEB APP

1. Login & authentication
2. Dashboard
3. Client Management
4. Site Management NEW
5. User Management
6. Roles & Permissions
7. Subcontractor Management
8. Staff Requests
9. Incident Management
10. Finance → Overview NEW
11. Finance → Site Profitability NEW
12. Finance → Ledger NEW
13. Finance → Invoices NEW
14. Finance → Budgets NEW
15. Finance → Reconciliation NEW
16. Finance → Expenses NEW
17. Chat (site / DM / group) NEW
18. Documents
19. All other web modules (14)

PART 2 — MOBILE APP

1. Startup reliability
2. Biometric login
3. Camera & photo capture
4. Documents view/download
5. Clock-in, location & map
6. Chat send reliability
7. All other mobile screens (14)

WRAP-UP

1. General regression checklist
2. Open issue — needs your help

Before you start

Web logins needed:

ROLE	WHY
INTERNAL (admin)	Can reach everything — your primary account for most of this document.
SUPERVISOR	Narrower sidebar than INTERNAL. Needed for the access-matrix checks below and Site Management.
CLIENT	Very restricted — needed to confirm Finance/Site Management/etc. stay hidden, including by typed URL.
SUBCONTRACTOR	Most restricted — needed for the same hidden-module checks, plus their own self-service Subcontractor Management flow.
Two logins (any role)	Chat testing needs two people messaging each other, in two separate browser sessions.

Mobile devices/logins:

WHAT	WHY
Physical Android device	Camera/gallery permission checks and location/map realism — an emulator is a fallback, not equivalent.
Physical iOS device with Face ID/Touch ID enrolled	Biometric login and the iOS camera-permission fix both need real biometric hardware.
A staff/subcontractor login that clocks in/out	Location prompt, GPS-tagged shifts, geofence checks.
A supervisor/admin login with map access	Live map presence checks.
Ability to toggle airplane mode / throttle network	Several reliability fixes only show up under a bad connection.

Also useful: a test client with 2–3 sites and some real invoices/expenses/budgets already entered, so Finance and Site pages aren't testing against empty states the whole time.

Role access matrix

Pulled directly from the routing code, so this reflects exactly what's enforced today. **"Sidebar-hidden"** means SUPERVISOR doesn't get a link to that page in their menu, but the route itself doesn't explicitly block them by role the way it blocks CLIENT/SUBCONTRACTOR — worth specifically testing: log in as SUPERVISOR, type the URL directly, and check whether the page actually loads data or the backend rejects it. That's a real permission boundary worth confirming either way, not assumed.

MODULE	INTERNAL	SUPERVISOR	CLIENT	SUBCONTRACTOR
Dashboard	**Yes**	**Yes**	**Yes**	**Yes (own dashboard)**
Client Management	**Yes**	**Yes**	**Own company only**	No
Add Client	**Yes**	No	No	No
Site Management (new)	**Yes**	**Yes**	No (blocked)	No (blocked)
User Management	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Incident Management	**Yes**	**Yes**	No (blocked)	No (blocked)
Staff Requests	**Yes**	**Yes**	No (blocked)	No (blocked)
Finance (all 7 tabs)	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
E-Learning	**Yes**	**Yes**	**Yes**	**Sidebar-hidden***
Master Configuration	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Staff Leave Request	**Yes**	**Yes**	No (blocked)	No (blocked)
Time Sheet	**Yes**	**Yes**	No (blocked)	No (blocked)
Send Notification	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Todo List	**Yes**	**Yes**	No (blocked)	No (blocked)
Subcontractor Management	**Yes**	**Yes**	No (blocked)	No (blocked)
Roles & Permissions	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Documents	**Yes**	**Yes**	**Yes**	**Sidebar-hidden***
Staff Payroll	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Document Creator	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Quotation	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
CRM	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)
Schedule	**Yes**	**Sidebar-hidden***	No (blocked)	No (blocked)

Chat	Yes	Yes	Yes	Sidebar-hidden*

* Sidebar-hidden = not in that role's menu, but not necessarily blocked if the URL is typed directly. This is exactly what to test — see the callout above.

PART 1 — WEB APP

Login & authentication

All roles

1. Log in with valid credentials for each of the 4 roles — confirm each lands on the correct default screen.
2. Log in with a wrong password — confirm a clear error, no partial/broken session created.
3. Use "Forgot Password" → confirm OTP delivery → verify OTP → reset password → log in with the new password.
4. Log in, then wait past normal token expiry (or ask engineering how long that is) — confirm the session either silently refreshes or cleanly redirects to login, never gets stuck in a broken half-logged-in state.
5. Log out — confirm you land back on login, and pressing the browser Back button doesn't reveal any cached private page content.
6. If you can point the app at a deactivated tenant, confirm it shows "This tenant account is currently inactive" rather than a generic error.
7. If you can simulate the API being unreachable at load time, confirm you get an "Unable to Connect" screen with a Retry button rather than a blank page.

Expect No role ever lands somewhere they shouldn't by default. No stuck loading states. Password reset actually works end to end.

Dashboard

All roles (different views)

1. Log in as INTERNAL/SUPERVISOR — confirm the standard Dashboard loads with real, correct numbers (cross-check a couple against Client Management/Finance directly).
2. Log in as SUBCONTRACTOR — confirm you land on the separate Subcontractor Dashboard, not the standard one.
3. Use the "All Sites" tab and its status filters (Active/Late/Completed/etc.) — confirm counts match what you'd expect from today's rosters.
4. Confirm sites with nothing scheduled today are excluded from "All Sites" specifically (this is intentional) but are still reachable via Site Management or their client.

Expect Numbers agree with the source-of-truth pages elsewhere in the app. No role sees another role's dashboard.

Client Management

Internal/Supervisor full · Client own-company only

Client list

Active/Deactivated tabs

1. Confirm the client list loads all clients on one scrollable page (no pagination), with working search and the Active/Deactivated tabs.
2. Add a new client — required fields, logo upload, address autocomplete on Address Line 1 (start typing a real address, confirm suggestions appear and selecting one fills city/state/etc.).
3. Edit an existing client's details and logo.

Deactivate/Activate

NEW

1. Pick a test client with 2+ active sites. Click "Deactivate Client" — confirm a dialog warns this will also deactivate the client's active sites before anything happens.
2. Confirm it, then check each site individually: every previously-active site should now be deactivated; any site that was already inactive keeps its original deactivation date untouched.
3. Reactivate the client — confirm sites do **not** automatically come back active (intentional). Reactivate a site manually to confirm that path still works.

Client detail tabs

1. Open a client, spot-check each tab loads: Site List, Documents, Invoices, Supervisors.
2. Log in as that client's own CLIENT-role user — confirm they see only their own company, never another client's data, in Client Management or anywhere else.

Expect Cascade only fires on deactivate, never reactivate. A CLIENT login can never browse another client's record.

Site Management NEW

Internal + Supervisor · hidden from Client/Subcontractor

New sidebar tab listing every site across every client in one place.

1. As INTERNAL: confirm the "Site Management" tab appears in the sidebar with a map-pin icon.
2. Open it — confirm sites from multiple different clients appear in one grid, each showing a client-name badge.
3. Search by site name, by client name, and by service type — confirm all three work.
4. Switch Active/Deactivated tabs — cards update accordingly.
5. Click a site card — confirm it opens that site's normal detail page.
6. As SUPERVISOR: confirm the tab is visible and behaves the same.
7. As CLIENT: confirm the tab is absent from the sidebar, *and* that typing the URL directly redirects/blocks you (403) rather than showing the page.
8. As SUBCONTRACTOR: same check as CLIENT.

Expect A CLIENT login can never see another client's sites through this page, via sidebar or typed URL.

User Management

Internal only (Supervisor: verify)

1. Add a new user, assign a role/user type, save — confirm they can log in with the credentials set.
2. Edit an existing user's role — log in as that user afterward and confirm their sidebar/access actually changed to match.
3. Deactivate a user — confirm they can no longer log in.
4. As SUPERVISOR, type the User Management URL directly (it's sidebar-hidden for this role) — confirm whether it loads data or is actually blocked server-side. Report which.

Roles & Permissions

Internal only (Supervisor: verify)

1. Create a new role, assign a specific set of permissions, save.
2. Assign that role to a test user — log in as them and confirm they can access exactly what the role grants, nothing more.
3. Edit an existing role's permissions — confirm already-logged-in users of that role see the change after their next login (or immediately, if permissions are live-checked).
4. As SUPERVISOR, type the Roles URL directly — confirm whether it's actually blocked server-side.

Subcontractor Management

Internal/Supervisor manage · Subcontractor self-service only

1. As INTERNAL/SUPERVISOR: add a subcontractor company, add supervisors under it, edit details.
2. Log in as that subcontractor — confirm they land on their own dashboard/detail and can add/edit their own workers (self-service is intentionally allowed).
3. Try to reach a *different* subcontractor's detail page or edit a different subcontractor's worker by tampering with the URL/id — confirm this is blocked, not just hidden from navigation.

Expect A subcontractor can manage their own data freely but is fully blocked from another subcontractor's, even via a guessed/edited URL.

Staff Requests

Internal/Supervisor

1. Open the pending requests list — approve one, reject one.
2. Confirm the requesting staff member sees the updated status (check on mobile if that's where staff submit from).

Incident Management

Internal/Supervisor

1. Report a new incident with required fields, submit.
2. Confirm it appears in the list and the report summary reflects it correctly.
3. If edit/close is supported, confirm that flow works too.

FINANCE MODULE — 7 AREAS

Finance → Overview NEW

Internal only

1. Check the 4 summary cards: Total Payments Received, Total Expenses Paid, Net Cash Flow, Pending Collections.
2. Check "Payments & Expenses Trend" shows up to 6 months, including zero-activity months (not skipped).
3. Check "Debtor Aging" pie chart — hover each slice, compare legend amounts against outstanding invoices.
4. Use the Maintenance Records widget: add, edit (site selector should be locked on edit), and delete a record — confirm it persists and badges color correctly by priority/status.

Expect Numbers match what you can independently total from Invoices/Ledger. Works even for a company with only 1–2 months of real data.

Finance → Site Profitability NEW

Internal only

1. Type a partial site name into search — list narrows live.
2. Filter by "Loss" — only negative-profit sites for the date range remain.
3. If more than 10 sites match, confirm pagination works.
4. Change the From/To date range — cards, totals, and profit numbers all update together.

Finance → Ledger NEW

Internal only

1. Confirm column order: Date / Description / Type / Amount / Tax / Status / Action.
2. Set From/To dates — only entries in range show, and Export Ledger only exports the filtered set.
3. Clear dates — full list returns. Reconciled entries' "Unreconcile" button still works.

Note No generic Edit/Delete icons on ledger rows — intentional, ledger entries are system-generated. Flag it back to us if you were expecting them from a mockup rather than assuming it's a bug.

Finance → Invoices NEW

Internal only

1. Confirm column order: Invoice No. / Company Name / Period / Total / Paid / Outstanding / Due Date / Status / Actions, and that Period shows a real date range.
2. Check the same table under a specific client's own Invoices tab — should look and behave identically (shared component).
3. Search and Status-filter still work post-reorder.

Finance → Budgets NEW

Internal only

1. Search by site name — narrows live.
2. Filter Over Budget / Warning (>85% consumed, not yet over) / On Track — confirm each bucket matches what the card's own progress bar/badge shows.

Finance → Reconciliation NEW · priority

Internal only

The Import Statement upload step used to be completely dead — this is the one to test most carefully.

1. Prepare a small CSV: header row (Date, Description, Amount), 3–5 data rows, and at least one description with a comma inside quotes, e.g. `"Payment, ref #123"`.
2. Drag-and-drop it onto the upload zone, and separately test "Browse Files" click-to-upload too.
3. Map Date/Description/Amount (or Debit/Credit), toggle GST, Preview Data.
4. On Review, confirm row count and amounts match exactly, including the quoted-comma row.
5. Sync to Ledger — confirm it completes and entries appear as pending/unmatched.
6. Try uploading a non-CSV file (.xlsx, .pdf) — should show a clear rejection message, not fail silently.
7. Switch to Match Transactions — confirm your imported rows appear under "Unmatched Bank Imports" and match one against a pending ledger entry.

Note .xlsx/.xls import was intentionally not restored — the library for it has an unpatched security advisory. Bank statements need to be re-saved as CSV first; that's expected.

Finance → Expenses NEW

Internal only

1. Filter Active / Paused / Completed — matches each row's Status badge.
2. Combine with the table's own search — both apply together.
3. Confirm New Transaction / Record / Delete still work (pre-existing, shouldn't have regressed).

BACK TO GENERAL WEB MODULES

Chat (site / DM / group) search NEW

All roles except Subcontractor

Core send/receive — site chat, DM, group

1. Site chat: send text, attach an image and a non-image file, reply-quote a message, edit and delete your own message, react with an emoji, pin/unpin a message (as admin), type `@` to trigger mention autocomplete, confirm typing indicator and "online now" presence show for the other person.
2. DM: same core send/attach/reply/edit/delete/typing checks. Reactions, pins, and mentions are intentionally not present in DMs — don't report their absence as a bug.
3. Group: create a group (admin), add/remove members, leave a group, confirm push-notification text includes the group name.

Contact picker search NEW

1. Open "New Message" — confirm a search box filters the contact list live, and shows a clear "no matches" state for a nonexistent name.
2. As admin, open "Create Group" — confirm its member picker has its own working search too.

Expect All core chat actions work across all three chat types (minus the intentionally DM-scoped-out features). Both search boxes filter correctly.

Documents

All roles except Subcontractor

1. Upload a document, confirm it appears in the list.
2. View it (eye icon) and download it — both should work without error.
3. As CLIENT, confirm you only see documents relevant to your own company.

All other web modules

These weren't touched this batch, but are part of a complete pass. Click each to expand its checklist.

E-Learning — Internal/Supervisor/Client

- Course/module list loads; open a course and confirm content displays.
- Mark a module complete if that's supported, confirm progress is saved.
- Confirm CLIENT-role users can access this (it's in their allowed module list) and see appropriate content.

Time Sheet — Internal/Supervisor

- View timesheet entries for a staff member and a date range.
- Approve/reject an entry if that flow exists.
- Cross-check against mobile: a staff member clocks in/out on mobile, confirm the entry shows up here correctly, including the newly-added GPS location.

Staff Leave Request — Internal/Supervisor

- Submit a leave request (or find one submitted from mobile), approve it, reject a different one.
- Confirm the approved/rejected status reflects back to the requester.

Staff Payroll — Internal only

- Open payroll for a pay period, confirm calculated amounts look sane against timesheet data.
- Mark a payroll record as paid, confirm status updates.
- As SUPERVISOR, type the URL directly — confirm whether it's actually blocked server-side (sidebar-hidden only for this role).

Schedule — Internal only

- Open the schedule grid, assign a shift to a staff member, reassign it to someone else, cancel a shift.
- Confirm deactivated sites and unassigned staff don't show incorrectly on the grid (this was previously buggy and fixed — worth re-confirming it still holds).
- Confirm shifts/leave display under the correct staff member, not a neighboring row (also a past bug).

Todo List — Internal/Supervisor

- Create a todo item, mark it complete, delete it.
- Confirm the sidebar link goes to a real page (previously pointed at a nonexistent route — fixed, re-confirm).

Send Notification — Internal only

- Compose and send a push notification to a staff member or group.
- Confirm it's actually received on a mobile device if you have one available.

Master Configuration — Internal only

- Spot-check whatever tenant-wide settings are configurable here (service types, categories, etc.) — change one, confirm it takes effect where it's used elsewhere in the app.

CRM — Internal only

- Add a lead, move it through pipeline stages, confirm the board/list reflects the change.
- Edit and delete a lead.

Quotation — Internal only

- Create a new quotation via the wizard, fill each step, save.
- Edit an existing quotation.
- If there's a send/convert-to-client flow, confirm it works end to end.

Document Creator — Internal only

- Create or edit a document template.
- Generate/export output from it, confirm it renders correctly.

Email Templates — Internal only

- Edit a template's content, save.
- Trigger the actual email it's used for (e.g. an invoice email) and confirm the sent email matches your edit.

Profile, Client Profile & Change Password — All roles

- Update your own profile info as an admin, and separately as a CLIENT (different profile view) — confirm each saves correctly.
- Change your password, log out, log back in with the new password.

Add/Edit Invoice (inside a client) — Internal only

- From a client's Invoices tab, create a new invoice and edit an existing one — confirm this full-page flow (recently redesigned to match Add Client's layout) works end to end.

PART 2 — MOBILE APP

Startup reliability

Any login BOTH

Two startup hangs fixed: a blank permanently-stuck screen if Firebase/notification setup threw (now shows a real error + Retry), and a gray loading overlay that could hang forever on a degraded connection (now times out at 20s).

1. Fresh install, launch normally on both Android and iOS — reaches login without hanging.
2. Launch and immediately toggle airplane mode on/off a couple of times (flaky, not fully-dead connection) — gray overlay resolves within ~20s instead of hanging forever.
3. Fully offline cold start still shows a sensible offline state (unchanged, already worked).
4. Attach a photo/file on a slow connection — upload is *not* cut off at 20s (uploads are exempt).

Biometric login

Any login BOTH

1. On a device with Face ID/fingerprint enrolled: log in once with password, then log out — confirm "Login with Biometrics" now appears.
2. Complete the biometric prompt — lands back in the app without a password.
3. Cancel/fail the prompt — falls back cleanly to password login, no crash.
4. On a device with no biometrics enrolled, confirm the option doesn't appear. On a brand-new install with no prior login, confirm it doesn't appear either.
5. iOS real device — confirm Face ID genuinely prompts (previously silently broken).

Camera & photo capture

Any login BOTH

1. Android fresh install: take a photo, confirm the OS permission dialog appears, and confirm it actually saves to the device gallery (check the real gallery, not just an in-app toast).
2. iOS real device fresh install: confirm both Camera and Photos permission dialogs genuinely appear.
3. Deny permission deliberately — clear message shown; granting later via Settings and retrying recovers correctly.
4. Use the NDIS file-attach dialog on a Site Work/Inspection screen — attach a photo and a larger file, confirm no crash and nothing is silently dropped.

Documents view/download

Any login BOTH

1. View and download a document normally.
2. On a throttled connection, download a larger document — has up to 60s now (was 20s).
3. Kill connectivity mid-view/download — clear error message, not a crash.
4. Android — check Settings → Apps → this app → Permissions: Photos/Videos should not be listed at all.

Clock-in, location & the live map

Staff + Supervisor BOTH

1. Turn off location services, open the app — prompted to enable it, with a link to settings.
2. Clock in with location on — succeeds, and (with map/backend access) shows a real GPS coordinate, not blank.
3. Clock out — location captured there too; checkout still succeeds even if location briefly fails (best-effort, non-blocking).
4. Clock in at a site with no geofence radius configured, stand still — no false "left the site" alert.
5. As supervisor: watch a clocked-in staff member on the live map, force-quit their app without a clean clock-out — their marker downgrades from "Online" to "Last location" after ~45 seconds.

Chat send reliability

Any two logins BOTH

1. Open a chat, enable airplane mode, try to send — clear "Not connected"/"Failed to send" message, composer doesn't silently clear as if it sent.
2. Restore connectivity — normal sending resumes, nothing duplicated.
3. Repeat for a DM and a Group chat, not just site chat — all three were fixed together.

Note Different, already-fixed bug from the web app's still-open live-delivery issue below — don't conflate the two.

All other mobile screens

Not touched this batch, but part of a complete pass.

Login, Register & Portal Selection — All logins

- Full login flow, forgot-password/verification/reset flow on mobile mirrors the web checks in area 01.
- If multiple tenants/portals are selectable, confirm portal selection routes to the right tenant.

Notifications screen — All logins

- Received push notifications appear in the in-app notification list, tapping one navigates to the relevant screen (chat message, incident, etc.).

Calendar — Staff/Supervisor

- Shifts/events display on the correct dates, tapping a day shows the right detail.

Company & Company Sites browsing — Client/Subcontractor

- Confirm a CLIENT login on mobile only ever sees their own company's sites, never another client's.

CRM — Internal/Supervisor

- Mirror the web CRM checklist — view/update leads from mobile.

Inspection — Staff/Supervisor

- Start a site inspection, fill checklist items, attach photos, submit.
- Confirm it appears correctly on the web side afterward.

Invoice viewing — Client

- Open the invoice list and an individual invoice detail — amounts and status match what's shown on web.

Leave Requests — Staff

- Submit a leave request from mobile, confirm it shows up correctly on the web Staff Leave Request page for approval.

Profile & Settings — All logins

- Update profile details, bank details, and emergency contact — confirm each section saves independently.
- Upload a profile document.
- App settings screen: toggle whatever's available (notifications, etc.), confirm it persists.

Quotation — Internal/Supervisor

- Create a quotation via the mobile wizard, confirm it matches what shows on the web Quotation module afterward.

Send Notification — Internal/Supervisor

- Send a notification from mobile, confirm the recipient receives it.

Site Assets & Site Maintenance — Staff/Supervisor

- View/add a site asset record.
- Create a maintenance record from mobile — confirm it appears in the web Finance Overview maintenance widget (area 01 above).

Subcontractor screen — Subcontractor

- A subcontractor login can view/manage their own workers on mobile, and is blocked from any other subcontractor's data.

Task Photo Upload — Staff

- Upload a photo against a specific task, confirm it attaches to the right task and is visible on web afterward.

Timesheet Review — Supervisor

- Review and approve/reject a staff member's timesheet from mobile, confirm it reflects correctly on the web Time Sheet page.

Todo List — All logins

- Create/complete/delete a todo item on mobile, confirm it stays in sync with the web Todo List.

Toolbox Talk — Staff/Supervisor

- Run through a toolbox talk record, confirm attendance/sign-off is captured correctly.

WRAP-UP

General regression checklist

Apply these across the whole app, not tied to one module.

1. **Responsive layout** — resize the browser to tablet and mobile widths on a few key pages (Dashboard, Finance, Site Management, Chat). No horizontal page scroll; wide tables/charts should scroll within their own container instead.
2. **Cross-browser** — spot check Chrome, Safari, and at least one mobile browser (Safari iOS or Chrome Android) for the pages you touch most.
3. **Empty states** — a brand-new client with zero sites/invoices/expenses should show sensible empty-state messaging everywhere, not blank pages or crashes.
4. **Loading states** — slow down the network (browser dev tools "Slow 3G") on a few data-heavy pages (Finance Overview, Dashboard) — confirm a visible loading indicator, not a frozen blank page.
5. **Error states** — force a failed API call if you can (dev tools "offline" toggle mid-action) — confirm a clear error message rather than a silent failure or crash.
6. **Search & filter composition** — on any page with both a search box and a status filter, confirm they combine correctly rather than one resetting the other.
7. **Permission spot-checks** — for every "hidden" cell in the role matrix above, try the direct URL as that role at least once. This is the single highest-value general check in this whole document.
8. **Data consistency across surfaces** — a value shown in two places (e.g. a site's active status on Site Management vs. inside its client, or an invoice total on Finance vs. inside the client's Invoices tab) should always agree.

OPEN ISSUE — WE COULD USE YOUR HELP REPRODUCING THIS

Chat messages sometimes don't appear live for the other person (web)

Reported: a message sends successfully and shows up fine after a refresh, but doesn't appear live on the recipient's screen without one. Happens across site chat, DMs, and groups on web — not isolated to one chat type. The code's been reviewed and looks structurally correct, so this needs an actual repro with browser evidence to pin down further.

1. Open two browser sessions (or one normal + one incognito), logged in as two different users who can message each other.
2. On the *receiving* side, open DevTools (F12) → Console tab, and leave it open.
3. Also open the Network tab → filter to **WS** → click the `tenant/ws` connection → watch its Messages sub-tab.
4. From the other session, send a message. If it doesn't show up live, screenshot both the Console and the WS Messages tab at that moment (even "nothing happened" is useful).
5. Note anything that seems related: how long the tab had been idle beforehand, whether switching tabs/apps first made a difference, whether it recovers on its own after a few seconds.

Prepared for QA · web on `staging`, mobile at build 2.1.3 (versionCode 64) · covers every module across both apps and all four roles. Ping back with anything that doesn't match "Expect," any permission-matrix surprise, and whatever you find on the open chat issue.
